

This burndown chart represents our progress throughout sprint 4. This sprint we chose to complete less stories than the previous sprint by doing 54 this time around. We wanted to clean up and bugfix our product, as well as add some new functionalities.

Since many of us don't typically use an agile management tool like Jira, most of us forget to update what we have finished over time, causing the cliffside near the end of the sprint. Also since sub-tasks don't count for points on completion and the features usually required them to be done in sequence gave the illusion of doing most of the work at the end of the sprint.

This time, we started the sprint late so there is a jump in the issue count as seen above. We prioritized fixing bugs and making the user experience better because we determined that functionality is more important to a user than non-integrated features. We focused on integrating existing features and added simple features such as the calendar onto pre-existing pages. We increased the usability of our website by adding things such as following, creating posts, creating courses, etc.

This chart outlines our group's ambition, but also a few overestimates during sprint 4.
